

1. You have given a Python list. Write a program to find value 20 in the list, and if it is present, replace it with 200. Only update the first occurrence of an item.

```
list1 = [5, 10, 15, 20, 25, 50, 20]
```

```
# get the first occurrence index  
index = list1.index(20)
```

```
# update item present at location  
list1[index] = 200  
print(list1)
```

2. Given a Python list, write a program to remove all occurrences of item 20.

```
list1 = [5, 20, 15, 20, 25, 50, 20]
```

```
# list comprehension  
# remove specific items and return a new list  
def remove_value(sample_list, val):  
    return [i for i in sample_list if i != val]
```

```
res = remove_value(list1, 20)  
print(res)
```

3.. Given a two Python list. Write a program to iterate both lists simultaneously and display items from list1 in original order and items from list2 in reverse order

```
list1 = [10, 20, 30, 40]  
list2 = [100, 200, 300, 400]
```

```
for x, y in zip(list1, list2[::-1]):  
    print(x, y)
```
