

1. Get the key of a minimum value from the following dictionary.

```
d = {'Physics': 82, 'Math': 65, 'history': 75}
x = min(d, key=d.get)
print("minimum value of the key is:", x)
```

2. Write a Python program to check if value 200 exists in the following dictionary.

```
d = {'A':100, 'B':200, 'C':300}
letter = input('Enter a letter: ')
if letter in d:
    print('The value is', d[letter])
else:
    print('Not in dictionary')
```

3. Merge two Python dictionaries into one

```
dict1 = {'Ten': 10, 'Twenty': 20, 'Thirty': 30}
dict2 = {'Thirty': 30, 'Fourty': 40, 'Fifty': 50}
print("output is:", dict1 | dict2)
```
